

PLX
INNOVATIVE OPTICAL SYSTEMS

**Space
Heritage**

Introduction

PLX Inc. has been fabricating space-qualified assemblies for over 40 years. Our optical technologies are an integral part of some of the world's most notable space missions and experiments.

Throughout the years, we have become accustomed to providing high-quality optics that will maintain their integrity and accuracy as well as withstand some of the harshest conditions and environments known.

Space Participation Timeline

- 1975** – NASA’s Apollo-Soyuz Mission.
- 1985** – NASA’s Discovery Shuttle Laser Test.
- 1990** – Ball Aerospace’s Relay Mirror Experiment.
- 1990** – NASA’s LACE Experiment.
- 1997** – NASDA’s Retroreflector in Space.
- 2000** – NASA’s Endeavor Shuttle Radar Mission.
- 2002** – NASA’s TES Spectrometer.
- 2003** – CSA’s ACE-FTS Spectrometer.
- 2003** – ESA’s PFS Spectrometer (Mars Express).
- 2005** – ESA’s PFS Spectrometer (Venus Express).
- 2009** – Keldysh’s Space Program.
- 2015** – NASA’s ICE, Cloud/Land Elevation Project.
- 2016** – ESA’s TIRVIM Spectrometer.
- 2016** – NEPTEC’s CAMS Metrology System.
- 2018** – Ball Aerospace’s AMCS Alignment System.
- 2020** – Meteosat Third Generation (MTG) program.

PLX

INNOVATIVE OPTICAL SYSTEMS

1975

Apollo-Soyuz Mission (1975)

Mission Status: **Completed**

Our space heritage dates back to 1975. We provided hollow retroreflectors for the Apollo-Soyuz Space Union between the Americans and Russians. These retroreflectors were used in the docking procedure to align the two spacecraft as well as measure gases in the vehicle environment.

PLX

INNOVATIVE OPTICAL SYSTEMS

1985

NASA Laser Test (1985)

Mission Status: **Completed**

In 1985, as part of NASA's Long-Distance Laser Test, PLX Inc. built an \varnothing 8" [203 mm] diameter retroreflector that was mounted to the space shuttle Discovery. Below is an excerpt from the Washington Post on the success of the test:

The Washington Post

Space Shuttle Succeeds in Laser Test

By Thomas O'Toole June 22, 1985

A beam of laser light fired from a mountaintop in Hawaii bounced off a reflecting mirror on the space shuttle Discovery today as it flew 230 miles overhead at a speed of 17,500 mph.

The event was the first "Star Wars" test between the Air Force on the ground and the National Aeronautics and Space Administration shuttle in orbit. After seeing the test botched two days earlier, the Air Force declared today's attempt a success. But it was not intended to solve any of the most difficult problems of setting up a "Star Wars" defense system. It also was not the first laser tracking test, but it probably was the most media-tracked of the tests in the Strategic Defense Initiative program, as it is formally known.

The "Star Wars" plan envisions knocking down enemy missiles with lasers or other weapons before they reach the United States.

"We demonstrated today that we can track a fast-moving target with a laser on the ground," Meyer said. "Our next step is to perform the same kind of test with rockets fired to an altitude of 360 miles to see if ground-based lasers can stay with them all the way to altitude."

Today's feat was not a technical advance, but one of a series of laser tests in the sky and space. Lasers were first observed from space by American astronauts 20 years ago and have been used by the Pentagon in various applications for the last 15 years. Laser telescopes on the island of Maui, where today's test was conducted, routinely reflect beams off Soviet spy satellites to determine what kinds of optical sensors they carry.

1990

Relay Mirror Experiment (1990)

Mission Status: **Completed**

INNOVATIVE OPTICAL SYSTEMS

After the success of the Laser Test, PLX Inc. gained significant recognition and was awarded a contract with Ball Aerospace to work on the Relay Mirror Experiment (RME). The experiment directed a 1.064 μm laser beam emitted from one ground site to a mirror orbiting at 450 km altitude, and then to a ground based target.

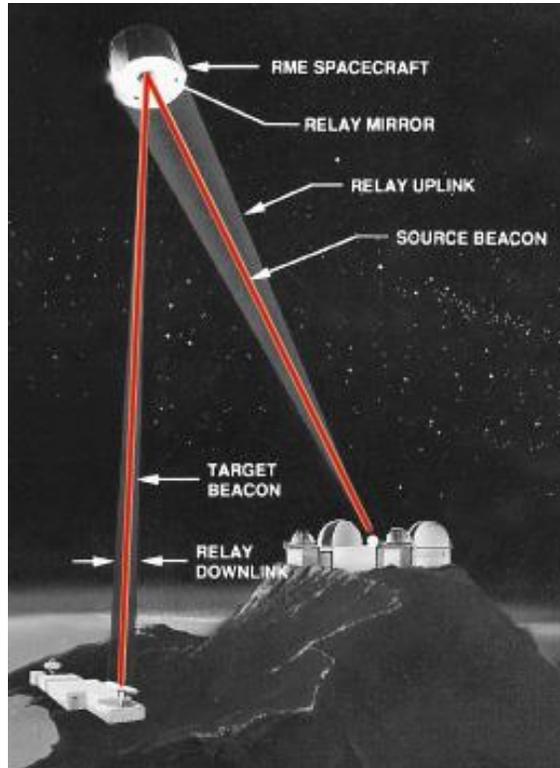

Image courtesy of David Darling

PLX also contributed to the Low-Power Atmospheric Compensation (LACE) Experiment that was launched as a dual payload with the RME.

INNOVATIVE OPTICAL SYSTEMS

1997

Retroreflector in Space (1997)

Mission Status: **Completed**

- The **Retroreflector in Space (RIS)** is one of several instruments aboard NASDA's (now JAXA) Advanced Earth Observing Satellite (ADEOS).
- RIS is a retroreflector for an Earth-Satellite-Earth laser used in long-path absorption experiments of atmospheric trace gases.
- PLX Inc. designed and manufactured a 20" [508 mm] diameter light-weighted retroreflector that achieved an accuracy of one arc second.

INNOVATIVE OPTICAL SYSTEMS

2000

Endeavor Radar Mission (2000)

Mission Status: **Completed**

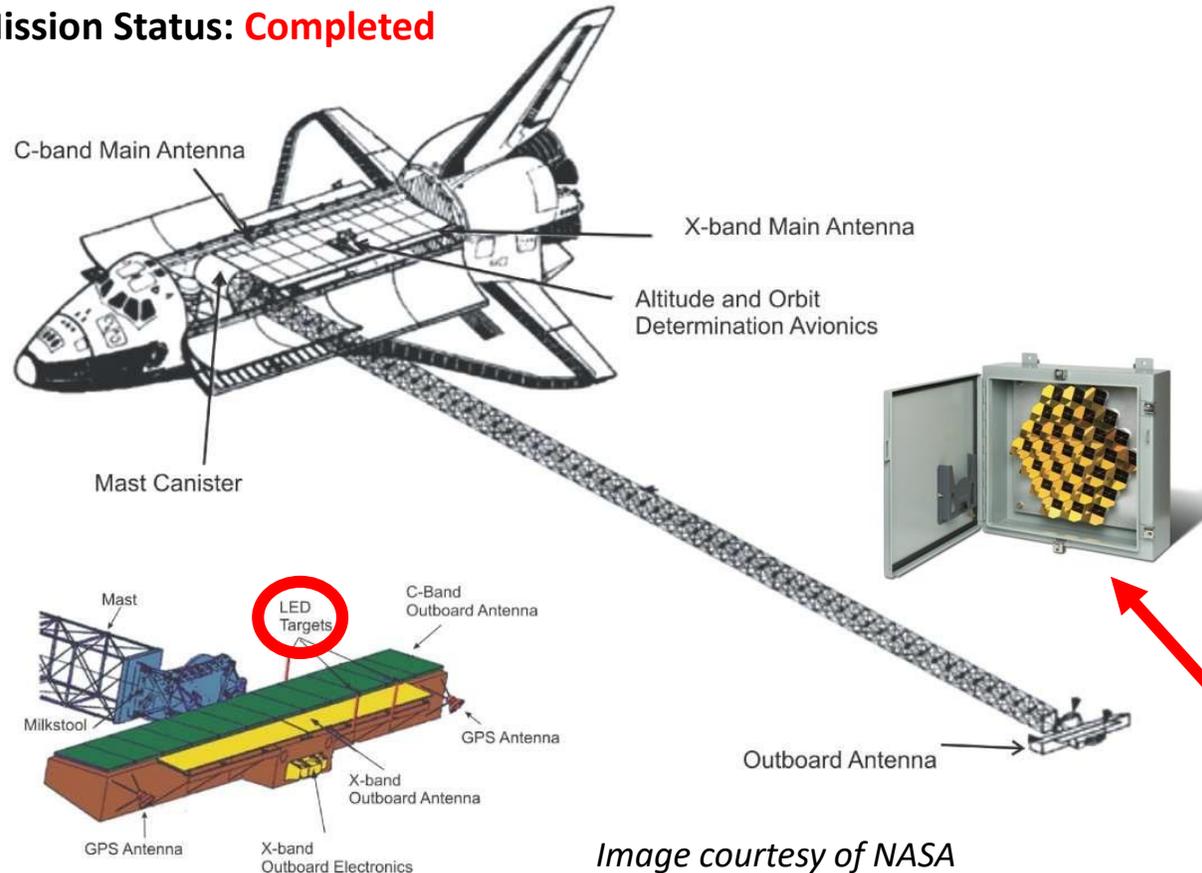

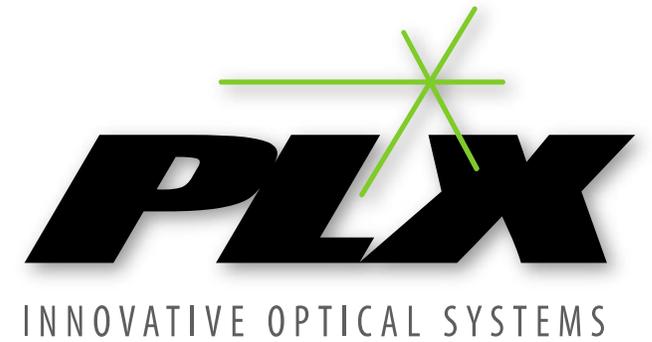

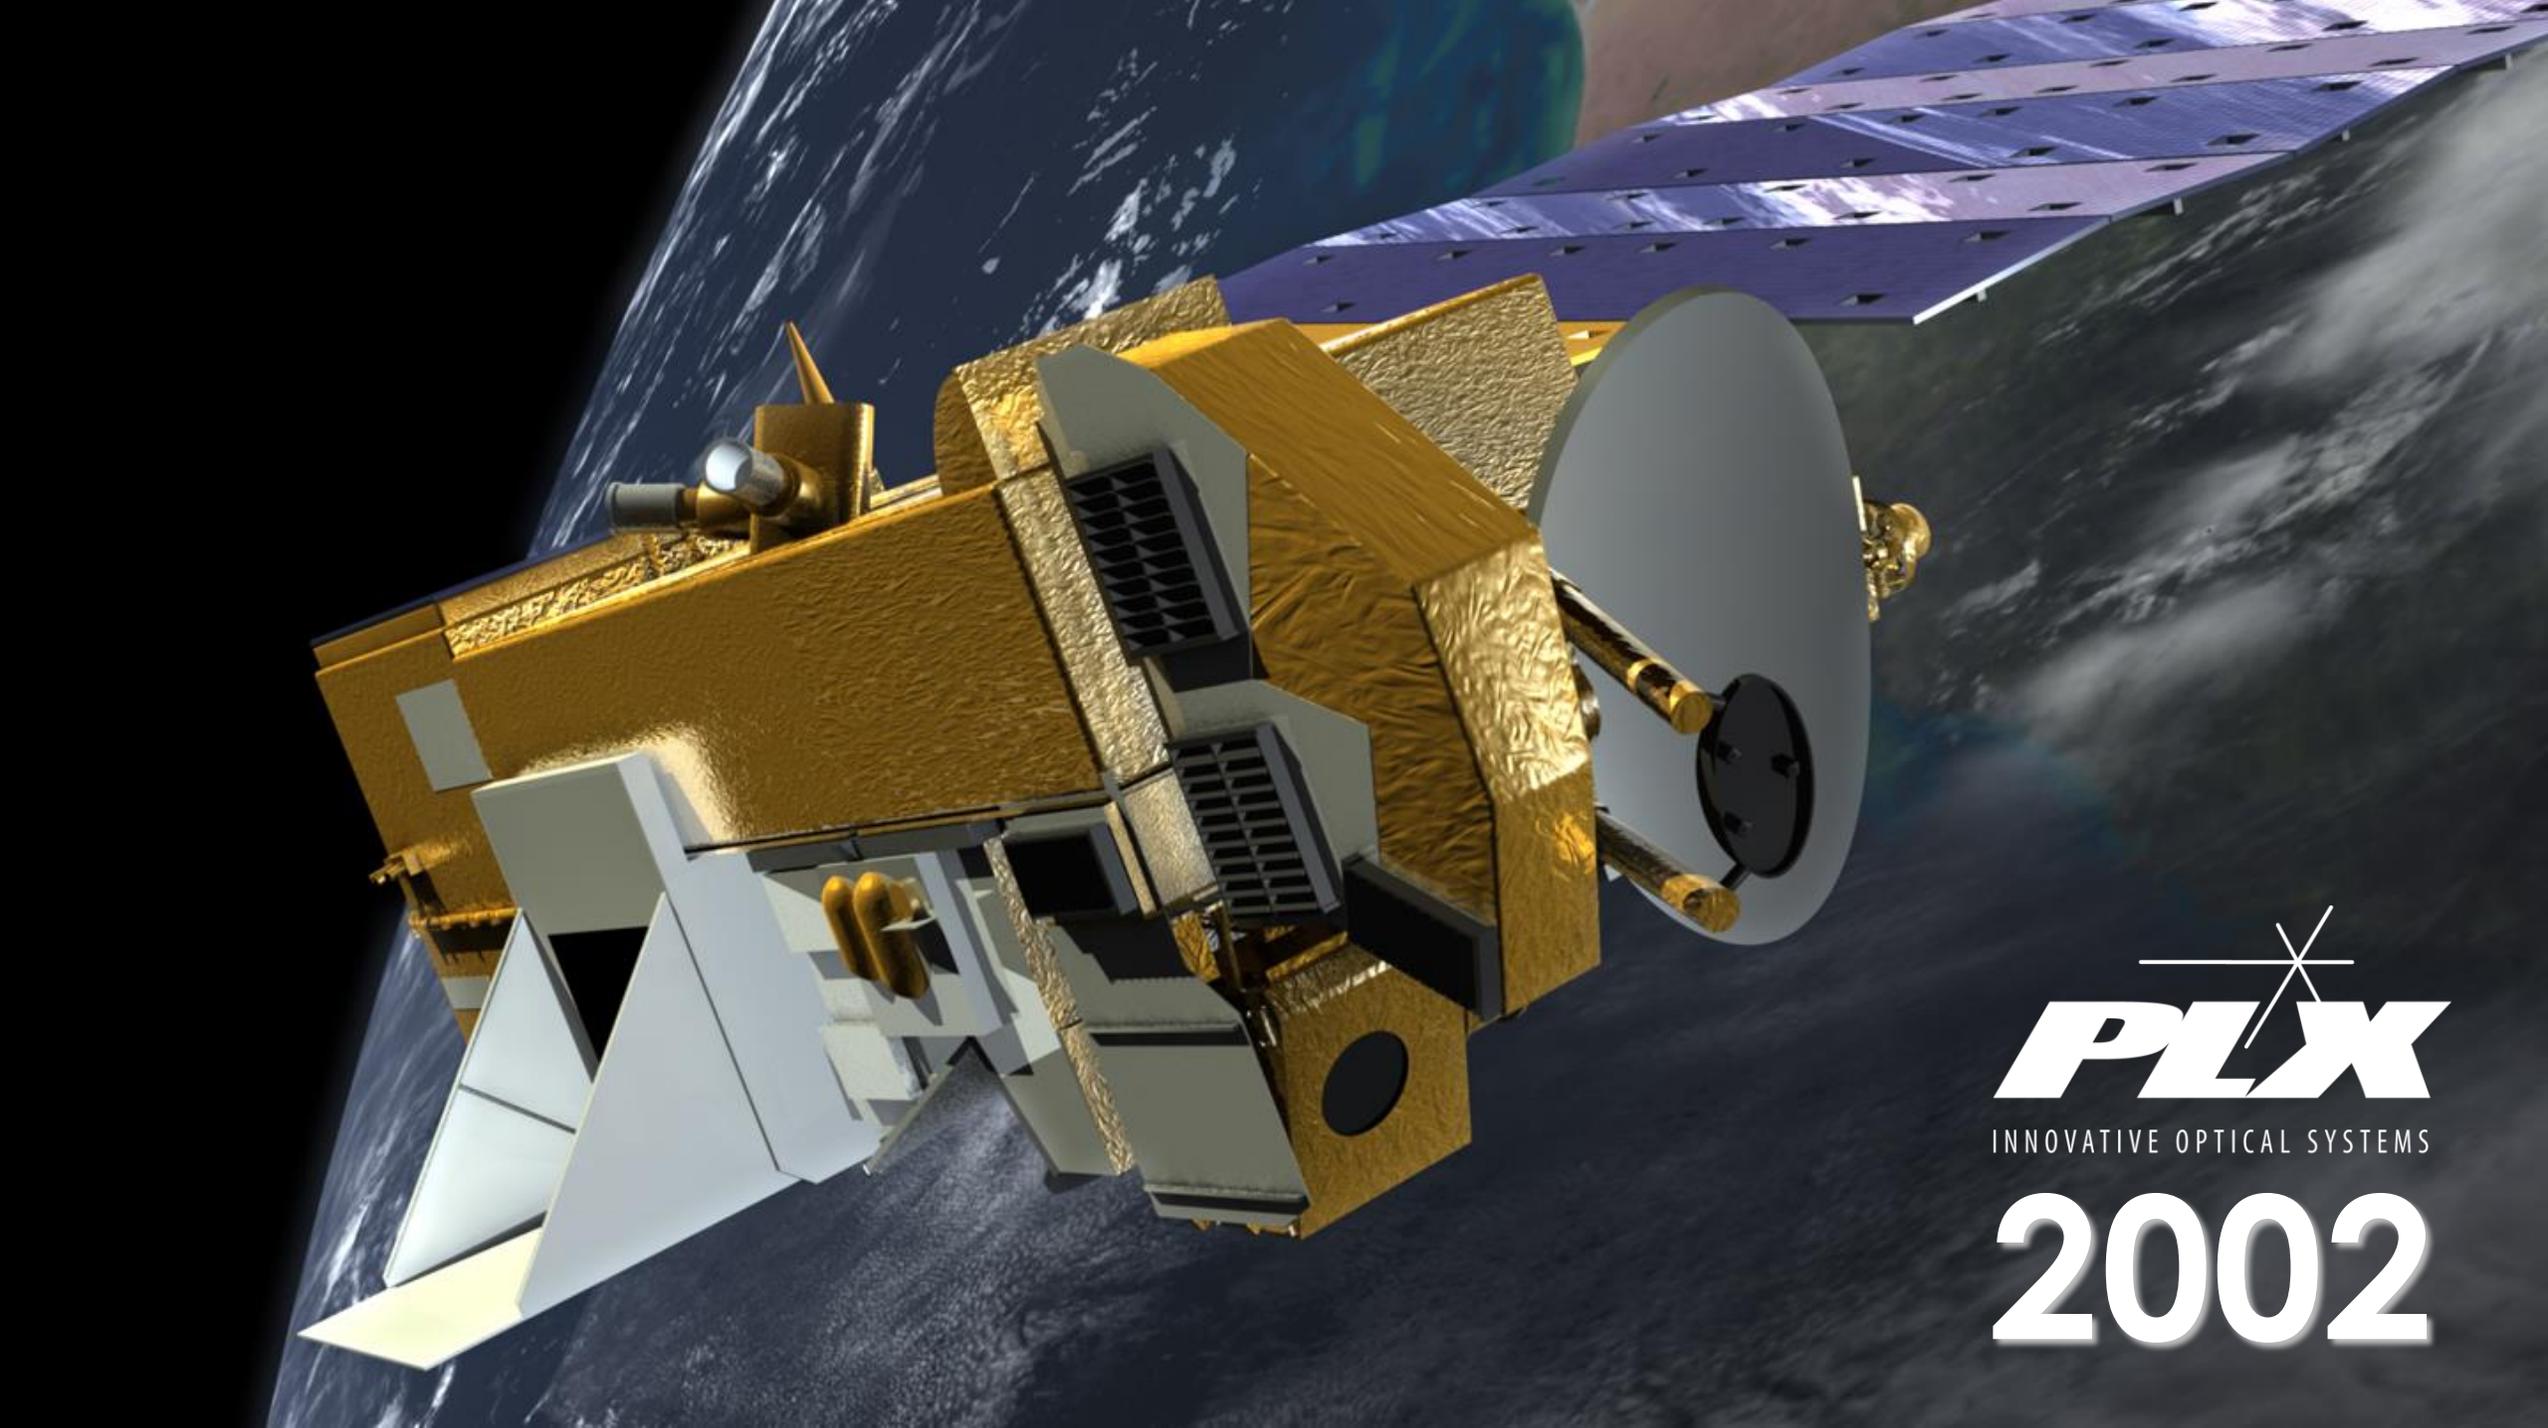

Image courtesy of NASA

- JPL deployed corner reflectors during the mission. These are highly reflective structures that appear as a bright point in the radar image.
- These reflectors deployed with precisely measured coordinates, served as control points in the Shuttle Radar Topography Mission data.
- PLX Inc. designed a Retroreflector Array™ for creating a high-resolution digital topographic database of the Earth.

2002

TES Spectrometer (2002)

Mission Status: **Active**

- The **Tropospheric Emission Spectrometer (TES)** is one of four instruments aboard NASA's Aura Earth Spacecraft (formerly known as EOS-Chem 1.)
- The spectrometer's main operation is to study the chemistry and dynamics of the Earth's troposphere, the lowest level of Earth's atmosphere.
- PLX Inc. provided **high-accuracy** beryllium mirrors and retroreflectors that were instrumental to the success of the spectrometer.

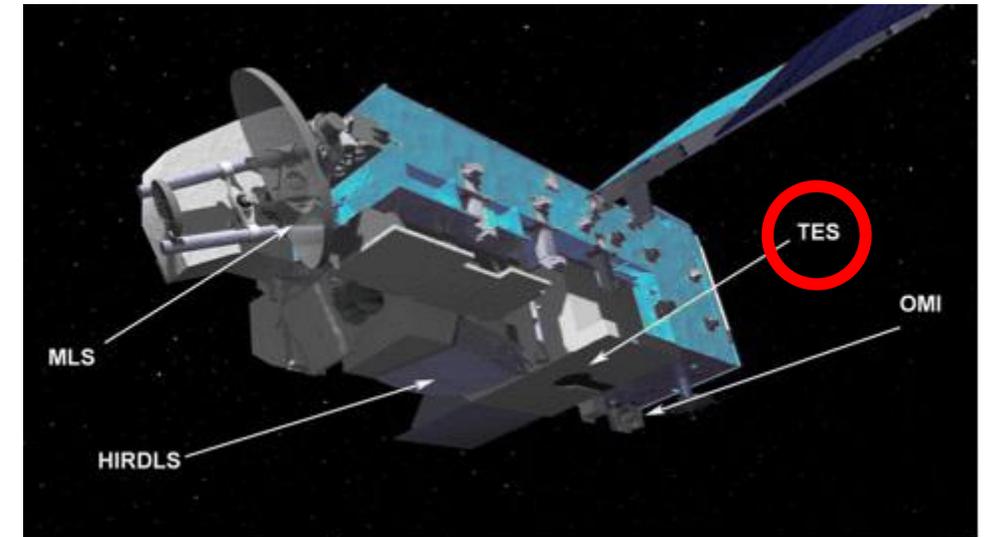

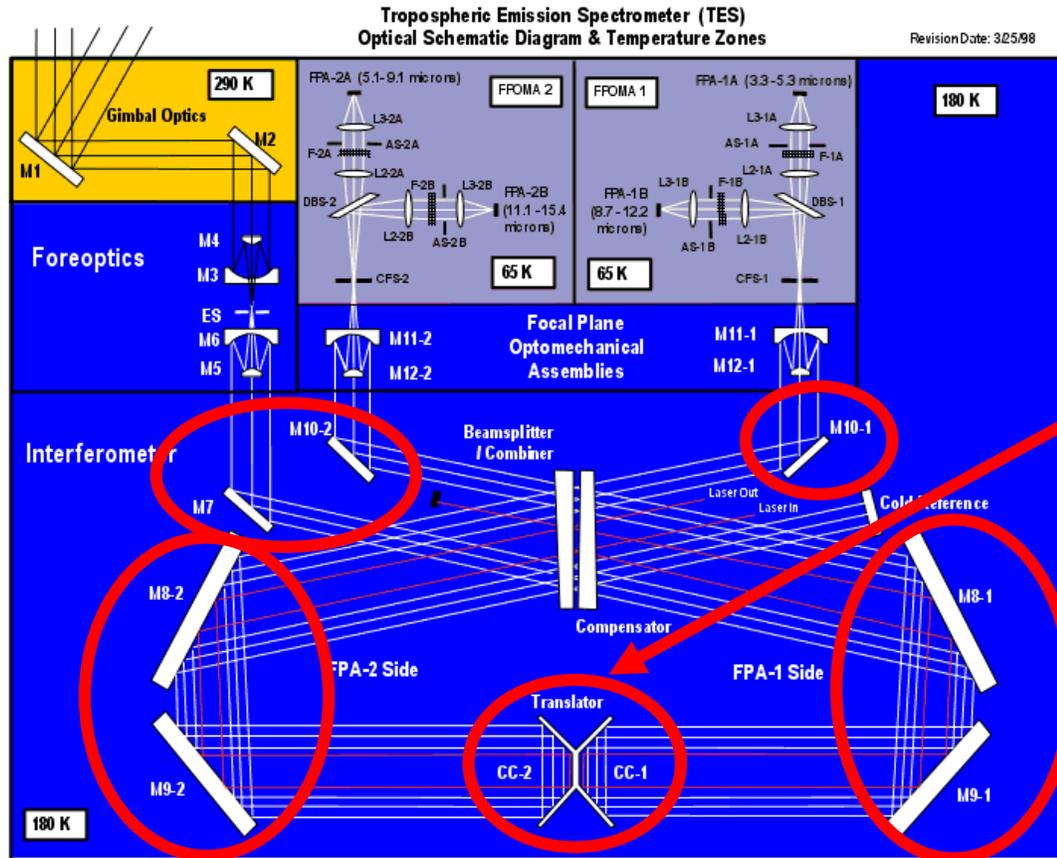

Image courtesy of SPARC

TES Optical Schematic

- TES is a high-resolution infrared-imaging FTIR spectrometer.
- The change in optical-path difference is achieved by back-to-back corner-cube reflectors (PLX Design) mounted on a translator mechanism.
- PLX Inc. also developed, designed and fabricated beryllium flat mirrors (M7 and M10) and roof mirrors (M8 and M9).

2003

ACE-FTS Spectrometer (2003)

Mission Status: **Active**

- The **Atmospheric Chemistry Experiment Fourier Transform Spectrometer (ACE-FTS)** is one of several instruments aboard the Canadian Satellite SCISAT.
- The spectrometer's main operation is to measure and understand the chemical processes that control the distribution of ozone in the Earth's atmosphere.
- PLX Inc. specially designed retroreflectors were used to provided modulation which was instrumental to the success of the spectrometer.

2005

PFS Spectrometer (2005)

Mission Status: **Active**

- The **Planetary Fourier Spectrometer (PFS)** is one of several instruments aboard the Venus Express Satellite. Another PFS is aboard the Mars Express (launched in 2003).
- The spectrometer's main operation is to study the atmosphere of both Venus and Mars as well as the soil composition on Mars.
- PLX Inc. specially designed retroreflectors were used to provide modulation on rotating interferometers.

INNOVATIVE OPTICAL SYSTEMS

2009

Keldysh Space Program (2009)

Mission Status: **Completed**

- PLX Inc. designed hollow retroreflectors for one of the instruments aboard the Meteor-M Satellite.
- The device's main operation is for hydro-meteorological purposes, remote sensing of the surface and atmosphere of the Earth.
- Data from this device is used for obtaining temperature/humidity profiles and trace gases monitoring, as well as for weather forecasting and prediction of climatic changes.
- These specially designed retroreflectors experienced sinusoidal modulation between the range of 10-100 Hz.

2015

ICESat-2 Testing (2015)

Mission Status: **Completed**

PLX supplied NASA a vacuum-compatible Lateral Transfer Hollow Retroreflector (LTHR). This unit was part of the ground support equipment for testing and verifying the Advanced Topographic Laser Altimeter System (ATLAS).

Unit Specifications:

- Clear Aperture: **5" [127 mm]**.
- Beam Displacement: **18.5" [470 mm]**.
- Overall Accuracy: **1 arc second**.

TIRVIM Spectrometer (2016)

Mission Status: **Active**

- The **Thermal Infra-Red V-Shape Interferometer Mounting (TIRVIM) Spectrometer** is one of three spectrometers on the Atmospheric Chemistry Suite (ACS) instrument on board the ExoMars 2016 Trace Gas Orbiter satellite.
- The spectrometer's main operation is to monitor temperature profiles and measure aerosol content during nadir observations.
- PLX Inc. retroreflectors were used for their ability to perform in harsh environments while maintaining exceptional stability and accuracy.

2016

CAMS Metrology System (2016)

Mission Status: **Active**

- The **Canadian Astro-H Metrology System (CAMS)** is an alignment system for the Hard X-Ray Telescope aboard the Astro-H observatory satellite.
- CAMS is designed to measure the lateral/rotational displacement in the spacecraft's optical bench relative to the instruments.
- PLX Inc. designed a 1.94" [49 mm] Invar mounted retroreflector with a 0.5 arc second accuracy which was used for alignment monitoring.
